

# SCIENTIFIC NOTATION

Scientific notation is a shorter method for writing very large and very small numbers.

93,000,000 is written  $9.3 \times 10^7$  in scientific notation.

$1 \leq \# < 10$  — always a base of 10

The constant (9.3) must be

greater than or equal to 1 and less than 10.

The power is always written with a base of 10

and an exponent

expressing the number of places the decimal was moved.

Big numbers have an exponent that is positive.

# bigger than 1

Example: 62,500 becomes  $6.25 \times 10^4$ . # of times the decimal point moves

Small numbers have an exponent that is negative.

# smaller than 1

Example: 0.0247 becomes  $2.47 \times 10^{-2}$ .

Remember to move the decimal so the coefficient is greater than 1 and less than 10.

## Practice

Write the following numbers in scientific notation.

1.  $256,000,000$  *big → pos. exp*

$2.56 \times 10^8$

3.  $68,092,000$  *pos.*

$6.8092 \times 10^7$

5.  $0.0000589$

$5.89 \times 10^{-5}$

7.  $1,368,500,000$

$1.3685 \times 10^9$

9.  $0.07070700$

$7.0707 \times 10^{-2}$

2.  $0.0036$  *small → neg. exp*

$3.6 \times 10^{-3}$

4.  $0.444$  *neg.*

$4.44 \times 10^{-1}$

6.  $90,800$

$9.08 \times 10^4$

8.  $0.00027$

$2.7 \times 10^{-4}$

10.  $674,000$

$6.74 \times 10^5$

### QUESTIONS TO THINK ABOUT...

How do you know that a number written in scientific notation will be a really big or a really small number?

When do you write a negative exponent when converting to scientific notation?

When do you write a positive exponent when converting to scientific notation?

## Changing from Scientific Notation to Decimal Form

When the exponent is positive, move the decimal to the right.  
 When the exponent is negative, move the decimal to the left.  
 The exponent tells you how many places to move it.

## Examples

---

11. $2.83 \times 10^5$ <div style="margin-left: 100px; color: red;"> <math>\textcircled{5}</math> move right         </div> <div style="margin-left: 100px; color: red;"> <math>2.83000</math>  <math>283,000</math> </div>	12. $1.23 \times 10^{-3}$ <div style="margin-left: 100px; color: teal;"> <math>\textcircled{-3}</math> move left         </div> <div style="margin-left: 100px; color: teal;"> <math>001.23</math>  <math>.00123</math> </div>
---	--

## Practice

---

13. $5.6 \times 10^0$ $5.6$	15. $4.9 \times 10^4$ $49,000$	17. $1.045 \times 10^7$ $10,450,000$
14. $8 \times 10^{-1}$ <div style="margin-left: 20px; color: blue;"> <math>\textcircled{-1}</math> left         </div> $.8$	16. $9.2 \times 10^{-8}$ $.000000092$	18. $8.4 \times 10^{-6}$ $.0000084$

## Evaluating Expressions in Scientific Notation

---

$$(1.4 \times 10^4)(7.6 \times 10^5)$$

$$(1.4 \times 7.6)(10^4 \times 10^5)$$

assoc.  
prop.

$$\begin{array}{r} 10.64 \times 10^9 \\ \hline 1.064 \times 10^1 \times 10^9 \\ \hline 1.064 \times 10^{10} \end{array}$$

You try!

$$19. (2.3 \times 10^3)(1.8 \times 10^{-5})$$

$$(2.3 \times 1.8)(10^3 \times 10^{-5})$$

$$4.14 \times 10^{-2}$$

## Evaluating Expressions in Scientific Notation

---

$$\frac{1.2 \times 10^{-1}}{4.8 \times 10^{-4}}$$

$$\frac{1.2}{4.8} \times \frac{10^{-1}}{10^{-4}}$$

$$.25 \times 10^3$$

$$2.5 \times 10^{-1} \times 10^3$$

$$2.5 \times 10^2$$

You try!

$$20. \frac{5.2 \times 10^3}{1.3 \times 10^1}$$

$$\frac{5.2}{1.3} \times \frac{10^3}{10^1}$$

$$4 \times 10^2$$

## Evaluating Expressions in Scientific Notation

---

$$\begin{aligned}
 (4 \times 10^{-2})^3 &= 4^3 \times (10^{-2})^3 \\
 &= 64 \times 10^{-6} \\
 &= \underline{6.4 \times 10^1} \times 10^{-6} \\
 &= 6.4 \times 10^{-5}
 \end{aligned}$$

You try!

$$\begin{aligned}
 21. \quad (5 \times 10^{-4})^2 &= 5^2 \times (10^{-4})^2 \\
 &= 25 \times 10^{-8} \\
 &= \underline{2.5 \times 10^1} \times 10^{-8} \\
 &= 2.5 \times 10^{-7}
 \end{aligned}$$
