

## 1.7 Solving Absolute Value Equations and Inequalities

- absolute value** - the distance a number is from 0
- always positive because distance is positive

An absolute value equation is in the form  $|ax + b| = c$ .

To solve an absolute value equation

when  $c \geq 0$ :

$$ax + b = c \quad \text{or} \quad ax + b = -c$$

*right*  $\swarrow$  *left*  $\searrow$

If  $c < 0$ , there is no solution.

Solve each absolute-value equation.

1.  $|x - 2| = 5$   $\swarrow$  *distance*

$$\begin{array}{r} x - 2 = -5 \quad \text{or} \quad x - 2 = 5 \\ +2 \quad +2 \quad \quad +2 \quad +2 \\ \hline x = -3 \quad \text{or} \quad x = 7 \end{array}$$

2.  $|x + 3| = -8$   $\swarrow$  *distance*

*no solution  
b/c distance  
can't be negative*

3.  $|2x - 1| + 3 = 17$

isolate absolute value

-3      -3

---

$$|2x - 1| = 14$$

$$2x - 1 = -14 \quad \text{or} \quad 2x - 1 = 14$$

$$\frac{2x}{2} = \frac{-13}{2}$$

$$x = -\frac{13}{2}$$

$$\frac{2x}{2} = \frac{15}{2}$$

$$x = \frac{15}{2}$$

4.  $\frac{1}{2}|x + 5| - 6 = -3$

+6      +6

---

$$2 \cdot \frac{1}{2} |x + 5| = 3 \cdot 2$$

$$|x + 5| = 6$$

$$x + 5 = -6 \quad \text{or} \quad x + 5 = 6$$

$$\frac{x}{1} = \frac{-11}{1} \quad \text{or} \quad \frac{x}{1} = \frac{1}{1}$$
